The study, led by UCI's Robert Naviaux and reported in the May 23 issue of Cancer Research, provides a new target for anticancer drug research that could one day help fight a disease

that has no known cure. "This is an example of a very successful drug, a drug with a novel mechanism of action, which we use to detect and localize receptors on cancer cells," Naviaux said. "In this case, the receptor we found was a voltage-gated calcium channel." Calcium ions are required for many critical cellular functions such as muscle contraction, blood clotting and cell signaling. Some calcium channels are already being used to treat chronic pain, but Naviaux and his team are the first to use a novel calcium channel, called the T-type

channel, to treat cancer. Naviaux and his team showed that cells with this receptor on their surface clump together and that they stick to blood

This package provides the R language equivalents of the R's base and utils packages. R's base and utils packages contain the most essential R functionality; those that

are not core and therefore, cannot be provided by other R packages. The base package is the primary source of functions and functions are used to manipulate the data in R. The utils package provides convenience functions for data manipulation, statistical methods, etc. The packages are of course, specific to R and therefore, cannot be used directly from other languages. Example usage: install.packages("foo") foo
